

Box plot showing the distribution of the parameter param for $n=10$ across five categories: 0, 005, 010, 020, and 050. The y-axis represents the value of param , ranging from 0 to 0.5. The plot indicates that for categories 0, 005, 010, and 020, the parameter values are concentrated near zero, with some outliers. For category 050, the parameter values are more spread out, with a median around 0.25 and several values extending up to 0.5.

Box plot showing Duration (s) for different param values (0, 005, 010, 020, 050). The y-axis ranges from 400 to 1000. The x-axis is labeled 'param'. The plot shows that as 'param' increases, the median duration decreases and the distribution becomes more spread out. The '0' group has the highest median duration (around 950s), while the '050' group has the lowest median duration (around 930s).
